

WE'RE HIRING!

FULL STACK

WEB DEVELOPER SENIOR

Care to Beauty, a leading e-commerce company in its sector and in an accelerated process of international growth, is looking for a Full-Stack Web Developer. You will be joining our current development team which consists of 5 Full-Stack Developers.

The core of our store is running on OpenMage LTS (a fork of Magento 1.9) (<https://github.com/OpenMage/magento-lts>) and is an integral part of our business and our success. Even though we are working with a legacy framework, like the Magento 1.9 framework, we are working hard to modernize our codebase by integrating code quality and static analysis tools (PHP CodeSniffer, PHP Mess Detector, Psalm), using Composer to install third-party libraries, ramping up efforts to integrate a test-driven development approach across our team and making sure our coding standards follow best practices regarding performance, security and style.

On the infrastructure side we plan to integrate an APM to monitor performance and health of the platform (Tideways), improve our development and production environments/workflows by using containerization (ECS, Docker, Elastic Beanstalk), create faster and more robust deployment processes.

In the near future we plan on redesigning our frontend. This does not mean we will migrate our core from OpenMage/Magento however this will be a chance to reboot our frontend to use the latest frontend best practices and technologies (e.g. CSS Grid, Typescript, Web Vitals) and take the time to improve all our current modules that are used in the frontend.

We are looking for developers that are interested in growing alongside the company and leverage their previous relevant experience to help the team grow and improve in all aspects.

Required Skills and Experience

- You have previous professional experience as fullstack developer working specifically with PHP 7+ for 5+ years
- You have experience working with databases, performing queries and analyzing its performance to detect bottlenecks and/or missing indexes
- You have plenty of experience working with HTML, CSS and any Javascript framework - You are comfortable writing tests and have experience working with PHPUnit (or equivalent frameworks such as Behat)
- You care about performance, security, coding standards and SOLID principles however you know how to balance pragmatism over perfection
- You have experience using Git as a version control system

Additional Valuable Skills and Experience

- You have worked with Magento 1.9 or OpenMage LTS in previous jobs actively developing modules and diving into the core source code - You know how to use debugging and profiling tools to your advantage for more efficient debugging and to help you understand performance bottlenecks in the store's runtime code (frontend and backend) - You know your way around various AWS services such as EC2, RDS and ElastiCache

Responsibilities

- Active development of new features for our e-commerce store as well as improving existing features - Perform maintenance and bugfixes on existing features
- Perform regular code reviews on pull requests made by your peers (and have your code reviewed of course)
- Contribute to the OpenMage LTS project by testing and fixing issues in the core that benefit us and the OpenMage ecosystem
- Identify shortcomings and opportunities to improve in the team, codebase and company

- Interact with different departments within the company such as supply/purchasing, logistics, customer support, marketing and content management to work on projects related to those departments

In the first 6 months

- If you don't have experience with OpenMage/Magento you will spend time getting up to speed with the framework, our tools and standards. We know Magento has a steep learning curve and everyone on the team will be there to help you with any issues you may face
- You will learn about the company and its internal processes regarding supply, logistics, marketing, content management and customer support
- You will be assigned tasks that will increase in difficulty as time passes and your skills improve - Give feedback on how we can improve our onboarding and development processes so that future hires can have an easier time than you did

Recruitment Process

Our recruitment process works in 4 steps. After each step you will get feedback and if this feedback is positive you can move to the next step of the process.

1. A conversation about the company, your experience, expectations and technical questions (a small part of the interview will be in English) (~2 hours)
2. A technical challenge, without a hard deadline, that you will take home and submit the solution (~5 hours)
3. We will perform a thorough code review of your submission and provide feedback
4. A final conversation to discuss details and our offer

Compensation

Base Salary: Salary is negotiable however keep in mind we are fully aware of the value of a seasoned full stack developer.

Adding to the base salary we have the following benefits:

Company Annual Bonus: 1% of the company's growth in terms of revenue split by everyone in the company

Individual Annual Bonus: Up to 2x your monthly gross salary

Extra Benefits

Health and Dental Insurance Access to Udemy Business (you can dedicate 4 hours per week to take courses and improve your skills)
